Assignment 1

“Good and bad design”

Diogo Lemos, 56837

Good Design:

The design of this wireless charger is in my opinion an upgrade when talking about regular flat wireless chargers.

Its reclined structure serves as a stand and provides a way to keep using the phone as it keeps facing towards us while charging.

Furthermore, the stand works with both the phone sitting vertically as well as horizontally.

It also has some more comfort features as it can be used as a pen holder and provides two USB ports for multiple devices charging at the same time.

Bad Design:

This portable vacuum cleaner might have some favorable features, but it has got one major problem that compromises its daily use.

Its overall weight is something that can't be reduced. And while it has some good rotation for maneuvering the vacuum cleaner around the area, its heavy weight produces a large amount of wrist pain.

Since it is a tool for daily use it should've been made lighter, even if it did worsen some other features, it would still made possible its main purpose. But with this in mind, the daily use of this tool can have significant damages in your hands and wrists.
